

Include flow chart for the high level implementation (include db, mobile app, API, Webhook, etc)

(Revised Final Flow)

Steps

Setup Subscription in Stores

Mobile App

- User selects subscription plan
- iOS sends appAccountToken
- Android sends obfuscatedAccountId

Apple App Store / Google Play Store

- Store processes payment securely
- Handles:
 - New Purchase
 - Renewal
 - Trial
 - Cancellation
 - Expiration
 - Restore Purchase

Webhook Sent to Backend API

- Apple → App Store Server Notification
- Google → RTDN (Pub/Sub Notification)

Validate & Verify Transaction

- iOS:
 - Verify JWT signature
 - Validate Apple certificate
- Android:
 - Verify purchaseToken using Google Play Developer API

Extract Important Information

- UserId
- ProductId
- TransactionId / OrderId
- Purchase Date
- Expiration Date
- Subscription Status
- Auto Renew Status

Check Duplicate Processing (Idempotency)

- Prevent duplicate webhook processing
- iOS:
 - Check NotificationUUID

- Android:
 - Check MessageId
 - Check PurchaseToken

Save Webhook Record

- Save webhook payload into database

- iOS Table:
[Subscription].[AppStoreWebhooks]

- Android Table:
[Subscription].[PlayStoreWebhook]

Process Subscription Logic

- Handle:
 - First Purchase
 - Trial Start
 - Renewal
 - Cancellation
 - Re-subscribe
 - Expiration
 - Grace Period
 - Payment Failure
 - Restore Purchase

Update UserSubscriptions Table

- Update:
 - Subscription Status
 - Expiration Date
 - Auto Renew Setting
 - Trial Information

- Table:
[Subscription].[UserSubscriptions]

Logging & Error Handling

- Save webhook JSON logs

Example:

user123_ios_20260430_143025.json

App Access Control

- Active Subscription → Full Access
- Trial Subscription → Trial Access
- Grace Period → Limited Access
- Expired Subscription → Restricted Access
- Cancelled Subscription → Access Until Expiry

Complete Implementation Steps

Phase 1 — Store Setup

Apple App Store

1. Go to App Store Connect → enable App Store Server Notifications v2
2. Add webhook URL: <https://yourdomain.com/webhook/ios>
3. Create subscription products (e.g. [com.newStarterPlan](#)) → submit for review
4. Generate App-Specific Shared Secret
5. Create Sandbox Tester account for testing

Google Play Store

1. Create Pub/Sub Topic in Google Cloud Console
2. Create Push Subscription → endpoint:
<https://yourdomain.com/webhook/android>
3. Grant publish permission to
google-play-developer-notifications@system.gserviceaccount.com
4. Link Pub/Sub topic in Play Console → Real-time developer notifications
5. Enable Google Play Android Developer API
6. Create Service Account → download JSON key → grant Finance permission in Play Console
7. Create subscription products (e.g. [com.sub3](#))
8. Add License Tester account for testing

Phase 2 — Database Setup

1. Create schema `Subscription`
2. Run table scripts in order:
 - `AppStoreWebhooks`
 - `PlayStoreWebhook`
 - `UserSubscriptions`
 - `WebhookProcessingErrors`

Phase 3 — Mobile App Setup

1. Integrate StoreKit (iOS) and Google Play Billing Library (Android)
2. On subscribe:
 - iOS → pass `appAccountToken` = `userId` (UUID format)
 - Android → pass `obfuscatedAccountId` = `userId`
3. Handle success/failure response from the store in the app
4. Implement Restore Purchase flow on both platforms

Phase 4 — Backend API Setup

1. Create two webhook endpoints:
 - `POST /webhook/ios`
 - `POST /webhook/android`
2. Both must return HTTP 200 immediately
3. Set up file system folders:
 - `/logs/ios/` and `/logs/android/`
 - `/errors/ios/` and `/errors/android/`
4. Set up Play Developer API client using service account JSON key

Phase 5 — Webhook Processing Logic

Build this flow in order:

1. Log raw payload to file → `{userId}_{platform}_{yyyyMMdd_HH:mm:ss}.json`
2. Duplicate check
 - iOS: check `NotificationUUID` in `AppStoreWebhooks`

- Android: check `MessageId` in `PlayStoreWebhook`
- If duplicate → return 200, stop
- 3. Android only → call `purchases.subscriptionsv2.get` using `purchaseToken`
- 4. Validate & extract
 - `UserId`, `TransactionId`, `ProductId`, `ExpiryDate`, `NotificationType`
 - On failure → save to `WebhookProcessingErrors` + write to `/errors/`
- 5. Save raw webhook to `AppStoreWebhooks` or `PlayStoreWebhook`
- 6. Route by notification type → update `UserSubscriptions`

Event	iOS	Android	Action
New purchase	<code>SUBSCRIBED/INITIAL_BUY</code>	type 4	Insert, Status = active
Renewal	<code>DID_RENEW</code>	type 2	Update ExpirationDate
Resubscribed	<code>SUBSCRIBED/RESUBSCRIBE</code>	type 7	Reactivate
Cancelled	<code>AUTO_RENEW_DISABLED</code>	type 3	AutoRenewEnabled = false
Re-enabled	<code>AUTO_RENEW_ENABLED</code>	—	AutoRenewEnabled = true
Expired	<code>EXPIRED</code>	type 13	Status = expired
Grace period	built-in	type 6	Limited access
Account hold	built-in	type 5	Restrict access
Recovered	<code>DID_RECOVER</code>	type 1	Status = active
Revoked	<code>REVOKE</code>	type 12	Revoke access

Phase 6 — Trial Logic (*pending Apple approval*)

1. Detect trial from notification type
2. Set `Status = trial` in `UserSubscriptions`
3. Save trial start & expiry dates
4. Grant full or limited access per policy
5. Schedule jobs:
 - Notify user before trial ends

- Notify user after trial ends
 - 6. On payment failure after trial:
 - Apply grace period with limited access
 - If still unpaid → cancel subscription
-

Phase 7 — Error Handling

1. Wrap all webhook processing in try/catch
 2. On error:
 - Insert into `WebhookProcessingErrors`
 - Write error file to `/errors/{platform}/`
 3. Always return HTTP 200 to the store regardless of errors
 4. Set up retry mechanism for failed DB operations
-

Phase 8 — Testing

1. iOS — use Sandbox Tester account on test device
 - Test: new purchase, renewal, cancel, expire, restore
 - Verify webhooks hit your endpoint
 - Check `AppStoreWebhooks` and `UserSubscriptions` are updated
 2. Android — use License Tester account
 - Test: new purchase, renewal, cancel, expire
 - Verify Pub/Sub messages reach your endpoint
 - Check Play Developer API call returns correct data
 - Verify acknowledgement happens within 3 days
 3. Duplicate test — send same webhook twice → confirm second one is ignored
 4. Error test — send malformed payload → confirm error is logged correctly
-

Phase 9 — Go Live

1. Switch Apple webhook URL to production
2. Switch Google Pub/Sub push endpoint to production
3. Replace Sandbox credentials with Production credentials
4. Monitor `/errors/` folder and `WebhookProcessingErrors` table closely for first 48 hours

5. Confirm first real purchase flows end-to-end correctly

Pending / Follow-ups

- Agree on grace period policy (how many days, what access level)

In App Purchase Document

1. User Identification

- Each mobile app user is assigned a unique user identifier stored in db.

2. Subscription Initiation (iOS & Android)

- When a user attempts to activate a subscription:
 - The app sends the user identifier to the respective app store:
 - iOS: `appAccountToken`
 - Android: `obfuscatedAccountId`

3. Store Processing

- The mobile app relies on the native store accounts (Apple App Store / Google Play) to handle the transaction.
 - Once the transaction is completed:
 - Status can be Success or Failure tbc
- Post API for backend/Rely on Webhook**
Make sure to handle duplication, idempotency

4. Webhook Notification (iOS & Android)

- Both stores send a server-to-server notification (webhook) including:
 - Transaction details
 - User identifier (Received in API but there is no Webhook for it as its a non-consumable type)

First webhook will save in respected

- [Subscription].[AppStoreWebhooks]/[Subscription].[PlayStoreWebhook]
[Subscription].[UserSubscriptions]
[Subscription].[WebhookProcessingErrors]

5. Webhook Handling

- Upon receiving the webhook:

- a. Logging

- Log each webhook payload
 - Store logs in a designated folder path
 - File naming convention:
[useridentifierbystore]_[platform]_[YYYYMMDD_HHMMSS]

Example:

user123_ios_20260430_143025.json

- b. Validation & Data Extraction

- Validate the request and extract relevant data:
 - User identifier
 - Payment status
 - Transaction details
 - Platform-specific data:
 - iOS:
 - Receipt ID
 - Manufacturer (Apple)
 - Package ID
 - Android:
 - Invoice ID
 - Product ID

- c. Trial Handling

- Execute additional logic if the subscription is a trial (if applicable)

If subscription is in trial:

- **Provide full or limited access based on trial scope**
- **Track trial start and expiry dates**
- **Send notifications before and after trial expiry**

Post-trial handling:

- **If payment fails after trial, follow payment failure rules**
- **Either cancel the subscription after failed attempts or apply a defined grace period with limited platform access (as per policy).**

6. Database Operations

- Save the transaction record in:

- [Subscription].[AppStoreWebhooks]/[Subscription].[PlayStoreWebhook]
- Update the user's subscription status in:
 - [User Subscriptions Table] [Subscription].[UserSubscriptions]
 - If error came then [Subscription].[WebhookProcessingErrors].

6. Restore Purchase -> Api call from app to inform its completed.

[TLDR]

-> Sample Webhook Response For Trial (iOS)

Android (Play Store) — Sample webhook payloads

Android RTDNs arrive via Google Cloud Pub/Sub as base64-encoded messages. The samples below show the decoded JSON. After receiving any RTDN, you must call the Play Developer API with the `purchaseToken` to get full subscription details — the RTDN alone does not include user info, price, or expiry dates.

Trial started — `notificationType: 7` → `SUBSCRIPTION_IN_GRACE_PERIOD` / **trialFired** when a free trial begins. No charge yet — user gets access for the trial duration.

Android

```
"version": "1.0",

"packageName": "com.rxcalendar",

"eventTimeMillis": "1777464000000",

"subscriptionNotification": {

  "version": "1.0",

  "notificationType": 7,

  "purchaseToken": "bkxyztrialtoken1234abcde.AO-JlOxK8mQp...",

  "subscriptionId": "com.newStarterPlan"

}
```

After receiving: call `purchases.subscriptionsv2.get` → check `subscriptionState = SUBSCRIPTION_STATE_IN_FREE_TRIAL`. Grant trial access. Log to `PlayStoreWebhook`, `upsert UserSubscriptions` with `Status = "trial"`.

First purchase — `notificationType: 4` → `SUBSCRIPTION_PURCHASED` Fired on the first paid subscription purchase (or when a trial converts to paid).

Android

```
"version": "1.0",

"packageName": "com.rxcalendar",

"eventTimeMillis": "1777468000000",

"subscriptionNotification": {

  "version": "1.0",

  "notificationType": 4,

  "purchaseToken": "bkxyzpurchasetoken5678fghij.AO-JlOyR3nLq...",

  "subscriptionId": "com.newStarterPlan"

}
```

After receiving: call `purchases.subscriptionsv2.get` → verify `subscriptionState = SUBSCRIPTION_STATE_ACTIVE`. Acknowledge the purchase within 3 days or it will auto-refund. Extract `obfuscatedExternalAccountId` to resolve `UserId`. Log to `PlayStoreWebhook`, upsert `UserSubscriptions` with `Status = "active"`.

Recurring renewal — `notificationType: 2` → `SUBSCRIPTION_RENEWED` Fired on every successful auto-renewal after the first billing cycle.

Android

```
"version": "1.0",

"packageName": "com.rxcalendar",

"eventTimeMillis": "1780060000000",

"subscriptionNotification": {

  "version": "1.0",

  "notificationType": 2,

  "purchaseToken": "bkxyzpurchasetoken5678fghij.AO-JlOyR3nLq...",

  "subscriptionId": "com.newStarterPlan"

}
```

After receiving: call `purchases.subscriptionsv2.get` → update `expiryTime` in `UserSubscriptions`. Renewals do not require re-acknowledgement. Same `purchaseToken` as the original purchase persists across renewals.

The `purchaseToken` values above are illustrative placeholders. Real tokens are long opaque strings issued by Google — never construct or validate them yourself. Always treat them as opaque identifiers and verify via the Play Developer API.

Notification type reference

Type int	Constant name	When fired
1	<code>SUBSCRIPTION_RECOVERED</code>	Payment recovered after account hold
2	<code>SUBSCRIPTION_RENEWED</code>	Successful auto-renewal

3	SUBSCRIPTION_CANCELED	User cancelled (still active until expiry)
4	SUBSCRIPTION_PURCHASED	New purchase or trial conversion
5	SUBSCRIPTION_ON_HOLD	Payment declined — account hold period
6	SUBSCRIPTION_IN_GRACE_PERIOD	Payment failed — grace period active
7	SUBSCRIPTION_RESTARTED	Subscription restarted (used for trial start in some flows)
8	SUBSCRIPTION_PRICE_CHANGE_CONFIRMED	User accepted a price change
9	SUBSCRIPTION_DEFERRED	Renewal date deferred by developer
10	SUBSCRIPTION_PAUSED	Subscription paused
11	SUBSCRIPTION_PAUSE_SCHEDULE_CHANGED	Pause schedule changed
12	SUBSCRIPTION_REVOKED	Revoked before expiry (refund/chargeback)
13	SUBSCRIPTION_EXPIRED	Subscription fully expired

Retry Logic for Failed Subscription Payments

Feature	App Store	Play Store
Grace Period	6–16 days (opt-in)	3–30 days (automatic)
Retry Duration	Up to 60 days	Up to 30 days
Access During Retry	Only with Grace Period enabled By developer	Yes (grace), No (account hold)
Auto-cancel After	~60 days	~30–37 days

Apple App Store

Apple does **not** send a dedicated "restore purchase" webhook. However:

- When a user restores a purchase, Apple sends a **SUBSCRIBED** or **DID_RECOVER** server notification (App Store Server Notifications v2)
- You can also use the **/inApps/v1/notifications/history** endpoint to query past events
- Relevant notification types related to restore:

Notification Type	When Sent
SUBSCRIBED	User re-subscribes or restores
DID_RECOVER	Billing issue resolved / recovered
REFUND	Refund granted
REVOKE	Entitlement revoked

- For **non-consumables** , restore doesn't trigger a server notification — you must call **verifyReceipt** or the **Transactions API** on the client side

In Apple in-app purchases, a **non-consumable** is a product the user buys **once** and owns permanently.

Examples:

- “Remove Ads”
- “Pro Upgrade”
- “Unlock Premium Features”
- Extra game levels bought permanently

Entity example: Non-Consumable In-App Purchase

Key behavior of non-consumables

- User pays once
- Purchase can be restored on new devices
- Does **not expire**
- Apple stores the ownership history

So when a user taps **Restore Purchases**, Apple usually:

1. Returns the purchase from the device/App Store account
2. Your app re-checks ownership using:
 - `verifyReceipt` (older approach)
 - App Store Server API / Transactions API (modern approach)

But Apple does **not** send a special “restore purchase” webhook for non-consumables.

That’s why the note says:

“For non-consumables, restore doesn’t trigger a server notification.”

Your backend must verify ownership after the app restores purchases locally.

Google Play Store

Google also has **no dedicated restore webhook**, but:

- Google Play uses **Real-Time Developer Notifications (RTDN)** via **Pub/Sub**
- Relevant notification types:

Notification Type	Code	When Sent
<code>SUBSCRIPTION_RECOVERED</code>	1	Recovered from account hold
<code>SUBSCRIPTION_RENEWED</code>	2	Renewed successfully
<code>SUBSCRIPTION_PURCHASED</code>	4	New purchase (includes restores in some cases)

SUBSCRIPTION_RESTARTED 7 User restores a cancelled subscription
